

Introduction to the APP :

Firstly, this case started when I was during the summer and winter holidays. I have a lot of hobbies to do during the holidays. Due to these many hobbies to be done, I end up being overwhelmed. Thus, I decided to build this app.

What App are we going to make?

This app is a seasonal hobby dashboard that plays as secondary memory during long breaks. It helps users smoothly rotate many hobbies such as video games, reading, language learning, etc. Thus, it also allows us to have progress and planning in improving those hobbies.

What features do we need to provide in the App?

The app centers around a clean, distraction-free workflow:

- **Seasonal Hubs:** You toggle between a warm-toned "Summer" dashboard and a cool-toned "Winter" dashboard.
- **Context Cards:** Each hobby (like *Zelda: BOTW* or *Guitar*) gets a visual card containing:
 - **The "Last Brain Dump":** A quick text note of exactly what you were doing last time (e.g., *"Just beat the Fire Temple, next is collecting arrows"*).
 - **The "Micro-Goal":** One tiny, low-friction task for next time (e.g., *"Practice fingerpicking for 5 minutes"*).
- **The Daily Selector:** A small feature that highlights just 1 or 2 cards a day so you do not suffer from decision paralysis.
- **Plan Advisor (Allows user to decide and plan their next hobby activity and they could have more less worrying about their next step!)**

Things we need to reconsider in building this app :

Some people might have different hobbies, it is best to make a feature to separate categories based on their hobbies. Such as, A user might have different hobbies such as photography, gaming and reading books. Meanwhile, the other user might have hobbies such as sports, music and language learning.

Also, we need this app to keep a records of our activities. Which this app allows us to remind of our activities that we have done during the previous days.

For example,

Monday : Played Zelda BOTW, Reading Books and Guitar Practice.

Tuesday : Learning Spanish, Doing Badminton and Reading Books.

Thus, it allows us to remember and make a better planning.

🔧 Best Tech Stack Choice!

- **Framework: Next.js (React) or Vite + React.**
- **Styling: Tailwind CSS.** It is perfect for quickly switching themes between summer aesthetics and winter aesthetics using simple utility classes.
- **Database / Storage: Supabase SQL**
- Need vercel to deploy the website
- **Google Gemma 4** (need it for future AI Assistant in planning)

Which means I need an API key from both Supabase and Google Gemma 4.

UI Design plan :
